December 1, 1976

The Honorable Marvin Mandel
Governor of Maryland
State House
Annapolis, Maryland 21404

Dear Governor Mandel:

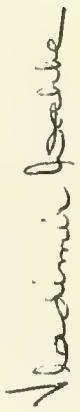

I am pleased to transmit herewith the Department's recently-completed report, "Maryland Projection Series - Personal Income, 1975-1985."

Prepared by our Planning Research Program Division, the report provides personal and per capita income projections for the State and its political subdivisions by five year intervals from 1975 to 1985.

The report constitutes a valuable addition to the Department's regional projection series, which presently includes employment and population. Taken together, the projection series not only provides a valuable analytical tool for planning carried out by State and local public agencies, but possesses also wide-ranging applicability for research and analysis undertaken within the private sector.

Copies of the report are being distributed to interested agencies and individuals throughout the State.

Sincerely,

Vladimir Wahbe

Enclosure

Introduction

Projection of personal income by major sources for the State and its political subdivisions constitutes an important addition to the Department of State Planning regional projections series, which presently include employment and population projections. Taken together, these projections are mutually consistent, and reflect detailed regional and national trends within the larger framework of national economic and demographic change.

Total personal income, its composition and growth reflect the level and general economic development within any given geographic area. Comparison of income by source and by residence discloses the net flow of income into or out of an area. Per capita income provides a measure of comparative average economic well-being and purchasing power of the residents of Maryland and its political subdivisions. As such, the Department's personal income projections may be regarded as a vitally important tool in the formulation of forward-looking public policies, plans and programs. They should also prove most useful in the conduct of private research and analysis.

labor and proprietors' income by place of work. In order to obtain the total earnings of the residents of each political subdivision, the residence adjustment is included (see definitions of terms) which accounts for net commuters' earnings. Accordingly, adjusted net labor and proprietors' income by place of residence plus dividends, interest and rent and transfer payments equal the total personal income by place of residence.*

National projections of total personal income and its components were utilized. In addition, estimates of employment by industry and total population for historical years for the State and its political subdivisions were obtained from the Regional Economics Measurement Division. Projected values for these variables and corresponding national figures were taken from Department of State Planning reports* and associated data bases.

Projection Methodology

Components of personal income for the State and its political subdivisions were projected for three major categories:

- (1) total earnings by industry
- (2) personal contributions for social insurance
- (3) property income and transfer payments

For historical years, 1962, 1965-1973, estimates of personal income by major sources for the United States, Maryland and its political subdivisions were provided by the Regional Economic Measurement Division, Bureau of Economic Analysis, U.S. Department of Commerce. The major sources include total earnings for twelve major industry groups, with sub-totals for non-farm, private and government sectors. Aggregate total earnings were provided also by three major types - wages and salaries, other labor income and proprietors' income, the latter of which were subdivided into farm and non-farm proprietors' income. Total earnings less personal contributions for social insurance yield net

minus the second plus the third. The first two categories are primarily related to the employment levels, while the third is more closely related to the population level and

* Maryland Projection Series. Population and Employment 1975-1990, Publication No. 240, May 1975.

its composition. Also, the first two categories are initially defined by place of work and the third by place of residence. To arrive at the total income for a political subdivision the first two have to be adjusted by adding the estimated net earnings of the subdivision's residents who work outside the area and subtracting the net earnings of other area residents who work in the subdivision.

Projection of Total Earnings by Industry

Total earnings include both total labor and proprietors' income by industry. Projected total earnings depend on future employment levels and future average earnings for each industry within a political subdivision. Future employment levels and the future national average earnings per job were based upon independently projected values.

For each industry there is assumed an identifiable relationship between the national and the local area's average earnings. Although at any given time the local average earnings are not equal to the national average, in the long run a close correspondence exists between national and local growth trends. Accordingly, local average earnings were not projected directly, but were related to the national average earnings observed for the historical period. Relative average earnings were projected for future years and then used to convert independently projected national average earnings into local average earnings, which when multiplied by the projected number of jobs yields local projected total earnings for each industry.

The computations were made on the basis of the following equations:

$$e_t = (ER_t/E_t) / (ER_t'/E_t')$$

where:

ER_t'/E_t = earnings to employment ratios for each industry for the State or subdivisions in historical years

ER_t'/E_t = earnings to employment, national ratios for each industry for historical years

e_t = ratios in historical years which were projected, one for each industry

With these projected ratios based upon the least squares method, earnings for the projected years were obtained, using the equation:

$$ER_Z = e_Z (ER_Z'/E_Z) E_Z$$

where:

e_Z = projected ratios as defined above

ER_Z'/E_Z = projected national earnings to employment ratios

E_Z = projected employment for the State or subdivisions

ER_Z = projected earnings for the State or subdivisions, for each industry and each projection year

The projected earnings for all industries for the State and political subdivisions were summed up and the resulting total labor and proprietors' income were subdivided into its components (i.e. wage and salary disbursements, other labor income and proprietors' income). The above procedure involved projecting each component, subject to the constraint that all projected components

had to add up to the projected totals derived from the previous steps.

Farm proprietors' income was projected as the share of total farm earnings and subtracted from total proprietors' income to obtain nonfarm proprietors' income.

Projection of Personal Contributions for Social Insurance

The procedure followed in projecting personal contributions for social insurance is similar to that used for the aggregate earnings by industry, as explained above. However, instead of employment for each industry, the total employment levels and average contributions for all employed are considered the dominant factors which determine the future levels of total personal contributions for social insurance.

The computations were made according to the equations:

$$s_t = (SI_t/E_t) / (SI_z/E_z)$$

$$SI_z = s_z (SI_z/E_z) E_z$$

where:

SI_t/E_t = ratios of total personal contributions for social insurance to total employment for the State and subdivisions in historical years

SI_z/E_z = national ratio of total personal contributions for social insurance to total employment in historical years

s_t = ratios in historical years to be projected

s_z = projected ratios

E_z = projected total employment for the State and subdivisions

SI_z/E_z = projected national ratios of total personal contributions for social insurance to total employment

SI_z = projected total personal contributions for social insurance for the State and subdivisions

Total earnings for all industries minus total personal contributions for social insurance equal total net labor and proprietors' income by place of work. To arrive at the same income by place of residence, this figure had to be adjusted for each subdivision for the net earnings of the subdivision's residents who work outside the area and the net earnings of other areas' residents who work in the subdivision. For the historical years, this "residence adjustment", as a net value was estimated for each subdivision by the Bureau of Economic Analysis. For the projected years such estimates, reflecting unknown future commutation patterns, could not be derived with a sufficient degree of reliability. Therefore, the residence adjustment for the last observed year, 1973, as a percent of total net labor and proprietors' income was assumed constant and used for each subdivision and for the State as a whole.

Projection of Property Income and Transfer Payments

Property income, which includes dividends, interest and rent, and transfer payments are the components of income which are defined exclusively by place of residence. Conceptually they are more related to the resident population of an area than to the employment levels, as was the case with the total earnings and personal contributions for social insurance. The procedure relates these components of income to total population rather

than employment. Consequently, it is the ratio of local areas to national per capita figures which are projected and applied to the independently projected national per capita figures and the local area populations.

The computations were made according to the equations:

$$r_t = (PT_t/P_t^1) / PT_t^1/P_t^1$$

$$PT_z = r_z (PT_z^1/P_z^1) P_z$$

where:

PT_t/P_t = property income or transfer payments to population ratios for the State and subdivisions in historical years

$^1 PT_t^1/P_t^1$ = national ratios of property income or transfer payments to population in historical years

r_t = ratios in historical years to be projected

r_z = projected ratios

P_z = projected population for the State and subdivisions

$^1 PT_z^1/P_z^1$ = projected national ratios of property income or transfer payments to population

PT_z = projected property income or transfer payments for the State or subdivisions

sources, measured after deduction of personal contributions to social security, government retirement and other social insurance programs, but before deduction of income and other personal taxes. It includes income received from business, Federal and State and local governments, households and institutions. It consists of wages and salaries (in cash and in kind, including tips and bonuses as well as contractual compensation), various types of supplementary earnings termed other labor income (the largest item being employer contributions to private pension, health and welfare funds), the net income of owners of unincorporated businesses (farm and nonfarm), including the incomes of independent professionals), net rental income, royalties, dividends, interest, and government and business transfer payments. Transfer payments consist in general of disbursements to persons for which no services are rendered currently, such as unemployment benefits, social security payments, medicare benefits, retirement pay of government programs, and welfare and relief payments.

Wage and Salary Disbursements

The definition is in accord with common usage. In addition, such disbursements include executives' compensation, commissions, tips and bonuses, and the value of payments in kind which represent income to the recipient, all before deductions for social security contributions, union dues, or other purposes. The contributions made by the employees under various social insurance programs, although counted in wage and salary disbursements, are not part of the personal income total. They are excluded by means of the deduction explained below.

Other Labor Income

Consists of supplementary types of labor income paid out or accruing in the current period. It comprises employer contributions to private pension, health and welfare, and group insurance plans; compensation for injuries; pay of military reservists; directors' fees

Definitions of Terms

Personal Income

The current income of residents of an area from all

Proprietors' Income

Measures the net business earnings of owners of unincorporated enterprises. Farmers, independent professional practitioners (such as physicians, dentists, and lawyers), entrepreneurs in nonfarm businesses and others in a self-employment status are included in the scope of proprietors' income. Two broad segments of this income component may be distinguished with respect to source, nonfarm and farm proprietors' income.

Total Earnings

The sum of wages and salaries, other labor income and proprietors' income. From another aspect, this same total is measured by source, for farm, eight other private sectors and three government sectors.

Earnings on a residence basis equals earnings on a place-of-work basis minus the earnings of persons who work in the given area but reside in another area, plus the earnings of persons who reside in the given area but work in another area. Therefore, the residence adjustment is such a net flow of commuters' earnings which is either added to or subtracted from the earnings, initially estimated on a place-of-work basis, to obtain earnings on a residence basis.

Property Income

Consists of rental income of persons, dividends and personal interest income. Also included is the imputed property income, such as imputed rent which measures the gross rental income accruing to residents of owner-occupied dwellings less the normal expenses incurred in home ownership.

Personal Contributions for Social Insurance

Contributions made by individuals, both employees and nonfarm self-employed, under the various social insurance programs are excluded from personal income. The employee portion covers contributions for Old-Age and Survivors Insurance, State unemployment insurance, railroad retirement insurance, cash sickness compensation, and Federal and State and local public employee retirement systems, as well as premium payments for Government life insurance. Contributions of the self-employed relate to Old-Age and Survivors Insurance only.

Gross and net labor and proprietors' income represented, respectively, total earnings before and after these contributions have been subtracted.

Transfer Payments

Comprises, in general, receipts of persons from government and business for which no services are rendered currently. Government transfers consist of Federal, State and local government payments such as old-age and survivors benefits, unemployment benefits, pensions under public employee retirement systems, direct relief, pension disability, and related payments to former members of the Military Establishment. Business transfers include such items as individuals' bad debts to business, corporate gifts, cash prizes, and personal injury payments by business other than to employees.

Per Capita Income

The estimated total personal income for an area divided by the total population of that area, for any given year.
